

## AQ-10 for adults (aged 16+) | Autism Research Centre

The AQ-10 helps indicate whether someone should be referred for an autism assessment. This version is for anyone aged 16 or above with suspected autism who does not have a learning disability.

	<b>Please tick one option per question only</b>	Definitely agree	Slightly agree	Slightly disagree	Definitely disagree
<b>1</b>	I often notice small sounds when others do not				
<b>2</b>	I usually concentrate more on the whole picture, rather than the small details				
<b>3</b>	I find it easy to do more than one thing at once				
<b>4</b>	If there is an interruption, I can switch back to what I was doing very quickly				
<b>5</b>	I find it easy to 'read between the lines' when someone is talking to me				
<b>6</b>	I know how to tell if someone listening to me is getting bored				
<b>7</b>	When I'm reading a story, I find it difficult to work out the characters' intentions				
<b>8</b>	I like to collect information about categories of things (e.g. types of car, types of bird, types of train, types of plant etc)				
<b>9</b>	I find it easy to work out what someone is thinking or feeling just by looking at their face				
<b>10</b>	I find it difficult to work out people's intentions				

### Scoring guidance

Only one point can be scored for each question.

- Score one point for "definitely" or "slightly **agree**" on questions 1, 7, 8, and 10
- Score one point for "definitely" or "slightly **disagree**" on questions 2, 3, 4, 5, 6, and 9

If the score is **six or above**, an autism assessment should be considered.

Please note that a diagnosis cannot be determined solely by a single score from this questionnaire. A formal diagnosis can only be made after a clinical assessment conducted by a trained professional.

This test was created by the Autism Research Centre - University of Cambridge
